Nano EHS

What are relevant exposure conc's?
Aerosols - possible
Workplace monitoring for inhalants (OELs)
Biological tissue-difficult
Environment - very difficult
Instrumentation needs

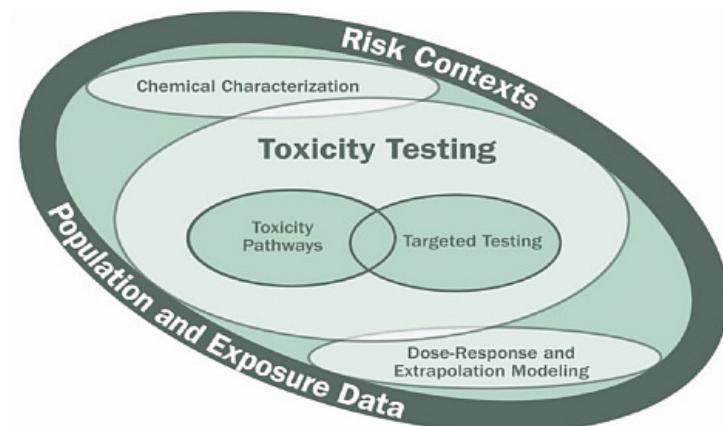

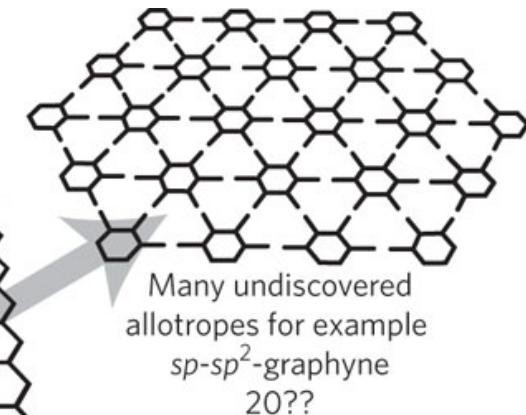

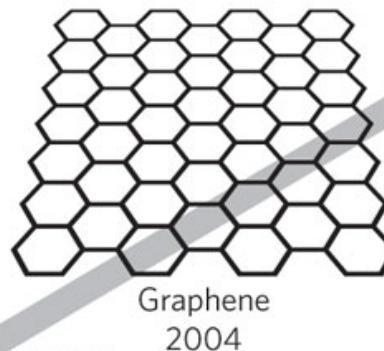

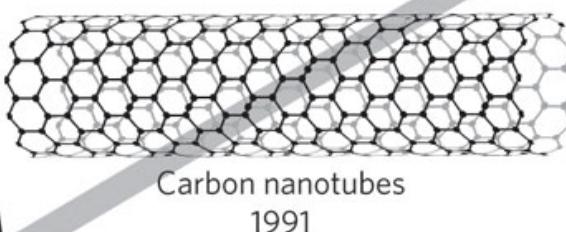

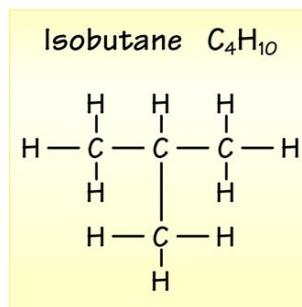

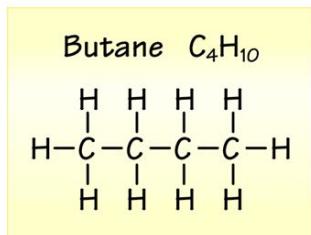

Little quantitative RA
Some qualitative RA
OELS
Tiered risk assessment
Integrated approaches to decision making (IATA)

Pristine Materials
New properties
“New chemical substances”
Case-by-case chem tox
Descriptive animal studies
↓
Mechanism-based screening
HTS & profiling of categories
Tiered testing approaches
Nano-enabled & composites

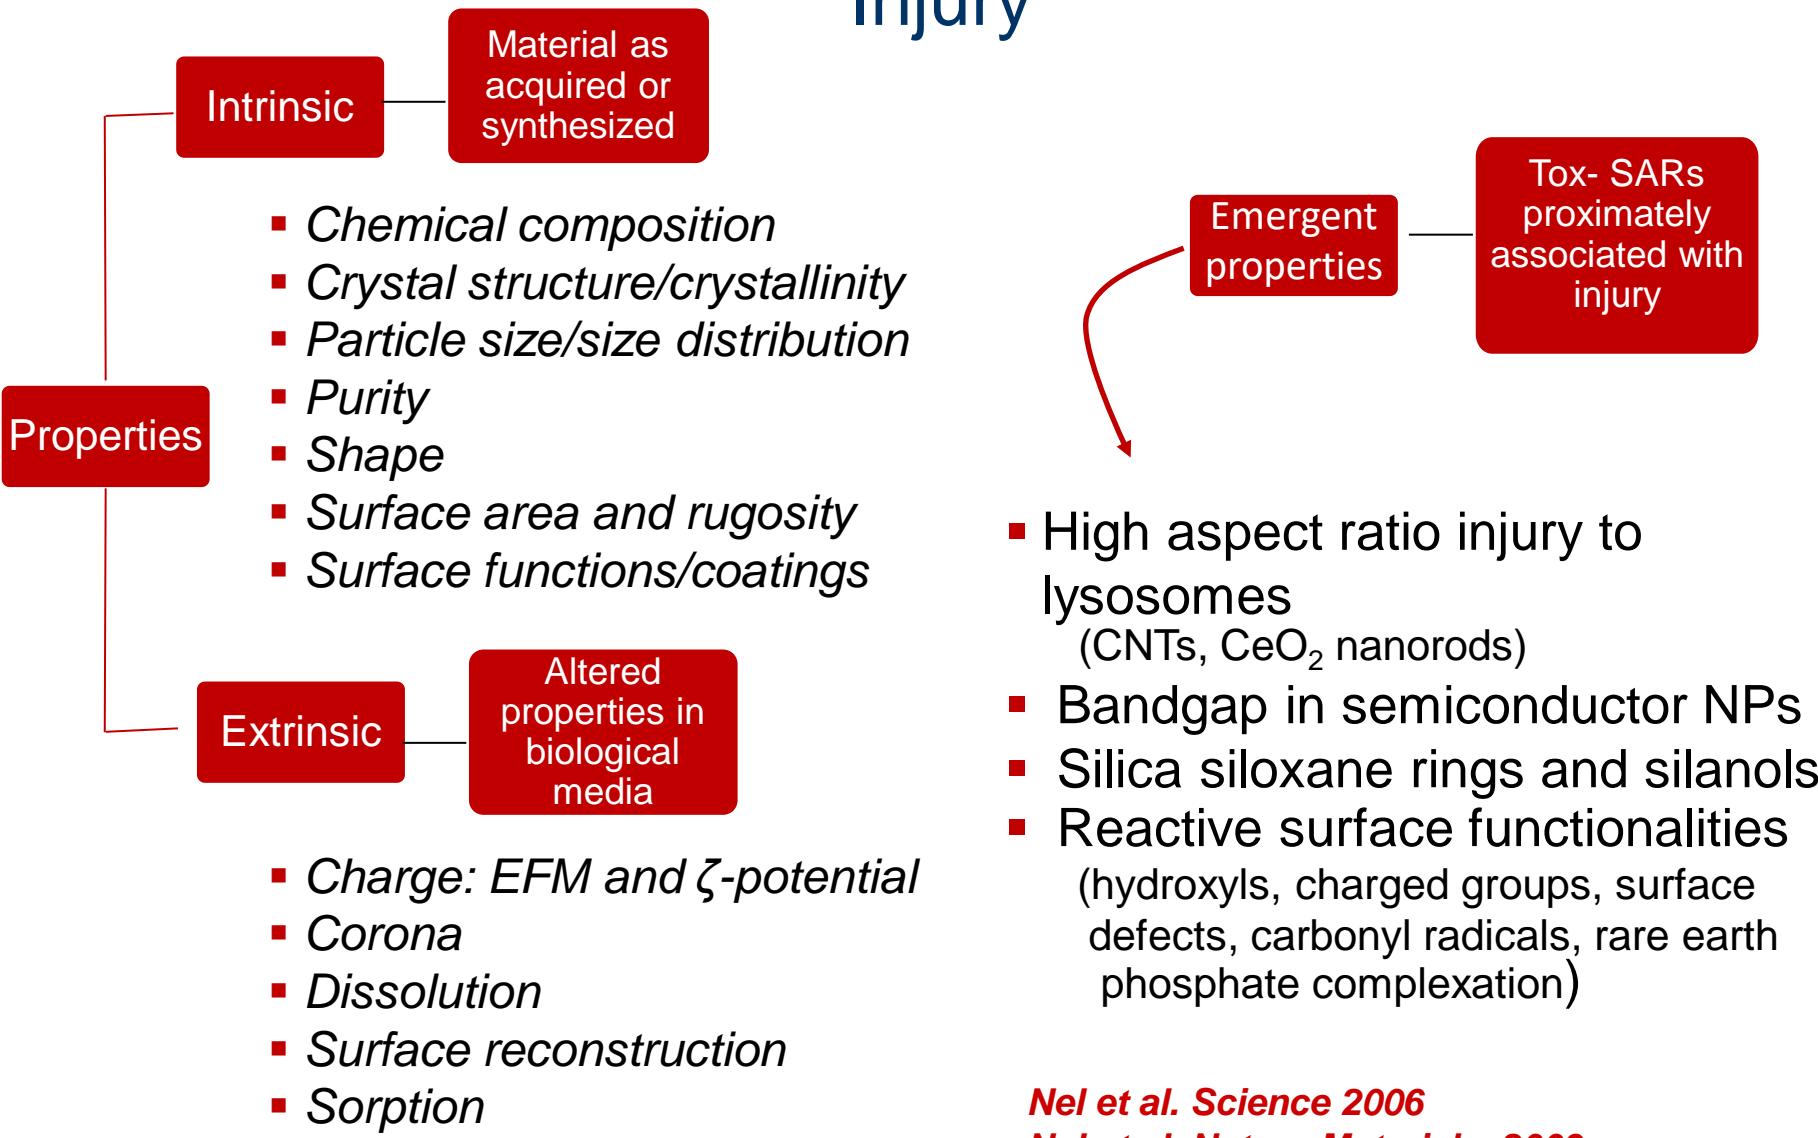

No human disease models
Progress in cellular dose calc
Occupational data - OELS
Benchmark materials
In vitro/in vivo extrapolations

Chemical Toxicity Principles not Optimal for Molecular Initiation or Triggering Events but useful for AOP assessment

Carbon as an example.....

There are Unique Nanoscale Characteristics that Contribute in a Unique Way to Trigger Molecular Injury

Nel et al. *Science* 2006

Nel et al. *Nature Materials*. 2009

The Frank R. Lautenberg Chemical Safety for the 21st Century Act (H.R. 2576), a.k.a. the TSCA Reform Bill

- Mandates, for the 1st time, the safety evaluation of all existing chemicals in commerce and industry, starting with those most likely to cause risks
- Evaluate and prioritizes new and existing chemicals against new science & risk-based safety standards, including considerations for vulnerable populations
- Require affirmative chemical/physchem data collection to support safety evaluation
- Clear and enforceable deadlines and timely action on identified risks
- Increase transparency of chemical information by limiting unwarranted claims of confidentiality, allowing appropriate sharing of confidential information
- Providing a source of funding for EPA to carry out these significant new responsibilities

June 22nd, 2016

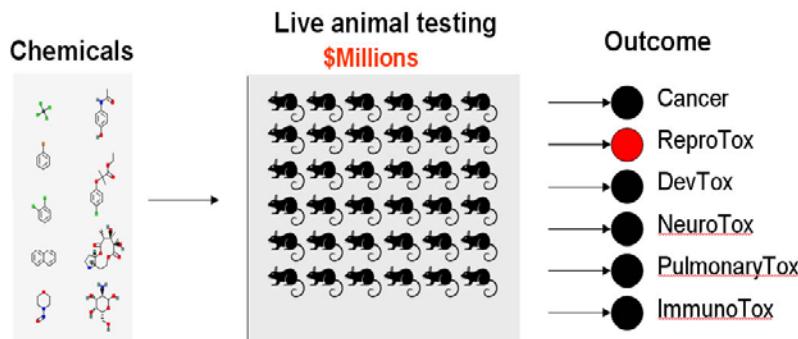

TSCA Reform Provisions for Alternative Test Strategies

" **(3D)** prior to adopting a requirement for testing using vertebrate animals, the Administrator is required to take into consideration, as appropriate and to the extent practicable, reasonably available:

- (i) toxicity information;
- (ii) computational toxicology and bioinformatics;
- (iii) high-throughput screening methods and the prediction models of those methods; and
- (iv) scientifically reliable and relevant alternatives to tests on animals that would provide equivalent information."

"**(4) TIERED TESTING.**.-

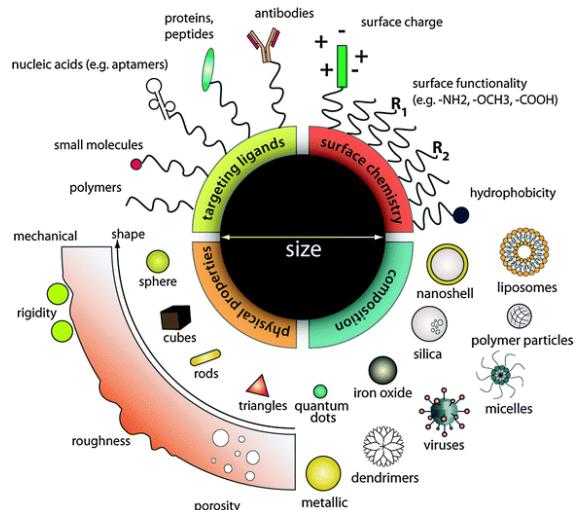

(A) IN GENERAL.-....the Administrator shall employ a tiered screening and testing process, under which the results of screening-level tests or assessments of available information inform the decision as to whether 1 or more additional tests are necessary."

NanoDatabank, Data Analytics and NanoEHS Decision Support Tools (www.nanoinfo.org)

Input raw Data, shared findings using Centralized Nanodatabank

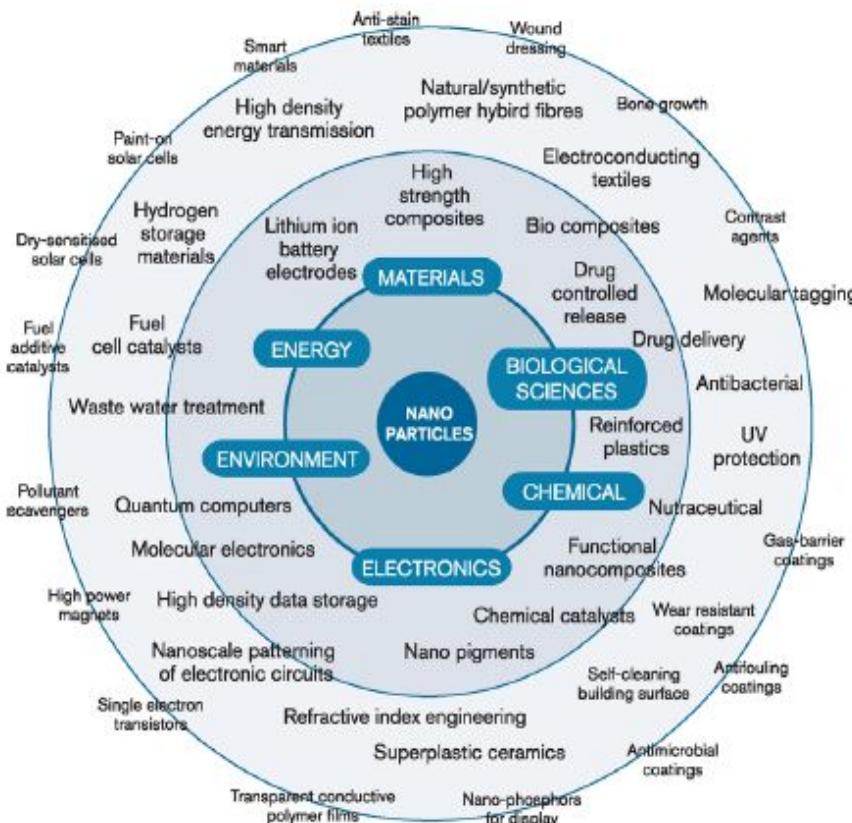

Estimate releases of ENMS, fate & transport analysis, analyze HTS data, toxicity predictions and decision analysis support tools

Pitfalls of Alternative Test Strategies

- ATS do not comprehensively capture biological processes in the context of intact organs or whole organisms
- *In vitro/in vivo* disconnect (offset by AOPs as *intellectual constructs*)
- Biased or incomplete coverage of injury response pathways
- False positives and false negatives
- Does not cover toxicokinetics and ADME
- No real-life exposure scenarios, including use of unrealistic dosimetry
- Only tests acute toxicological events, not chronic or repetitive exposures

Rapid Evolution in Current Nano EHS Regulatory Assessment needs: Pristine vs Nano-enabled Products

Nanomaterials
Nano-intermediates
Nano-enabled
Products

New EPA Section 8 Reporting Rule triggering reporting PhysChem Data (Jan 2017)

- Size
- Coating
- Shape
- Zeta potential
- Surface area
- Dispersion stability
- Surface reactivity

Expanded range of Industry Actors due to the new rule

- Grinding
- Mixing
- Formulating
- Dispersing
- Surface coatings
- Dispersion stability
- Surface reactive materials

CEIN Broad Capabilities for Implementing the use of ATS for Nano EHS Assessment and Governance

- Predictive toxicological profiling of individual and broad material categories (data bank, comparison grid, modeling)
- Use of AOPs and HTS to assist data collection for IATA and regulatory decision making
- Assist industry in developing new integrated test strategies for emerging nano-enabled materials and nano-composites
- Tailor experimentation to relevance of potential exposures
- Safer design principles based on structure-activity analysis
- Simulations, modeling, LCA

ATS at the R&D and Design Stage

- Demonstrate whether change in manufacturing process alters biological response
- Adjust surface chemistry or coating on “new grade” material to match registered “base” material
- Demonstrate “equivalency” to an approved competitor product (or benchmark materials)
- Could examine “extremes” in a CNT-family to develop ranges on which SNURs are based
 - E.g., Company X 12 MWCNTs (4 PMN-numbers)

The Story about the CNT Commercial Enterprise

(2015)

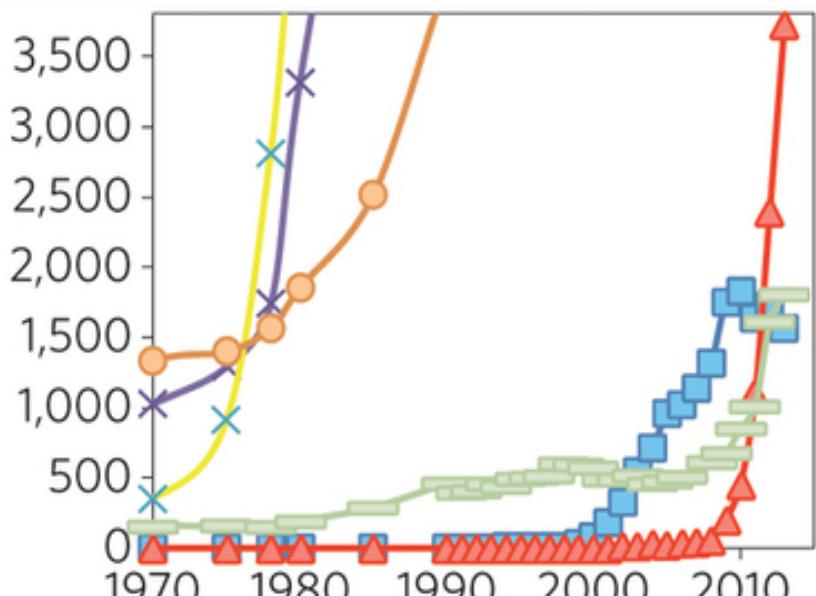

The hype over **CARBON NANOTUBES** has died down, but researchers believe the structures still have potential

MATT DAVENPORT, C&EN WASHINGTON

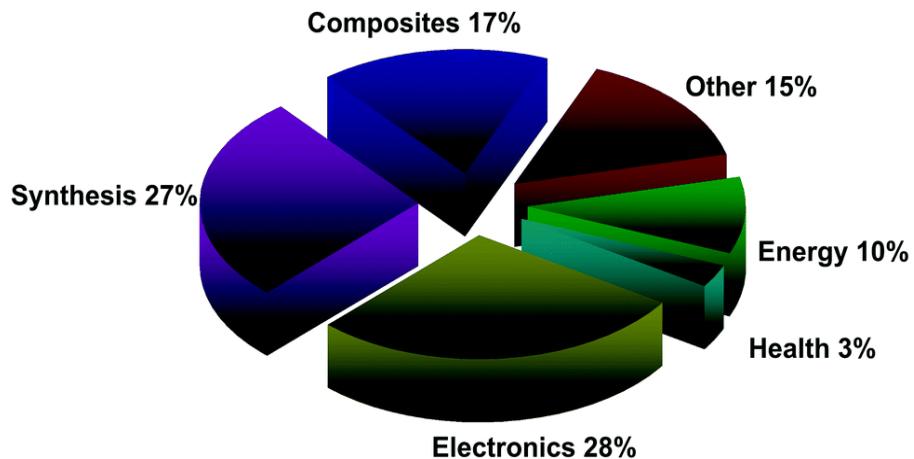

- Over expectation/hype
- Over production relevant to demand
- Technical issues: purity, crosslinking
- Incorporation into other products
- Risk avoidance
- Risk perception: “the next asbestos”

Will History Repeat Itself for Graphene?

Nature Nanotechnology, October, 2014

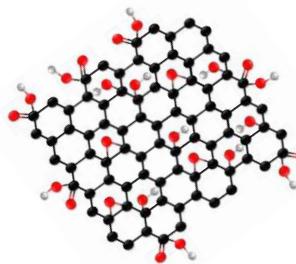

- Carbon nanotube
- Graphene
- Silicon
- Carbon fibre
- Polyethylene
- Polytetrafluoroethylene

The trajectory of graphene is following a similar path to carbon nanotubes with patents being filed at an even quicker rate.
